The Stats module shows the live status of the Sage Math Cloud server (Salvus). For more on Salvus: [▶ Link](#)

This module uses Javascript, JSON, and WebSockets to communicate with a Sage Math distributed node.js server. A JSON request is sent for the current stats, a reply is parsed and printed to the document. These stats are refreshed everytime you open the Sage Math Extension.

Lastly, some Sage Math resource links are available for quick access.

Search SageMath Documentation

Search

The second module provides quick access to the online Sage Math documentation.

Any terms entered here are passed directly to the same action page as Sage Math's search form when the "Search" button is clicked.

Additional search locations could be added, or a parsed set of results with scrollability!

WorldMill / Fiona is very efficiently sized at just under a half MB. of which only a few files and sections of code make use of Cython. Often Cython is used in this project to hook into lower level functionality and efficiency..

The third module provides an easy access place to save notes and other information.

Information can be entered in the same way as any web text field. The module uses your browser's local storage to store the information. The information is saved automatically on each key stroke (and in some other cases as well, but this mechanism is not fully complete).

Additional functionality is in the works, examples:

- Save notes as .txt
- Remote storage
- Share (image, pastebin, email, etc)
